

Neuropsychology Center of Utah

NPCU provides comprehensive neuropsychological and psychological evaluations to children, adolescents and adults presenting with various brain based disorders, including ADHD, Autism, depression, anxiety, traumatic brain injury, dementia, PTSD and other developmental disabilities. We also provide comprehensive treatment services such as cognitive behavioral therapy, parent training, educational consultation and social skills training.

As a specialized center, we follow closely and participate in innovative mental health and behavioral studies, which allows us to provide our patients with the highest quality care available.

OUR METHODOLOGY

Although frightening, neuropsychological and psychological disorders are manageable. We work directly with our patients and their loved ones to identify all the tools and resources needed to treat the patient's condition and to improve their quality of life.

We have learned over the years that behavioral disorders are best treated through a proactive, evidence-based method. The action plan we create for our patients, following a comprehensive neuropsychological evaluation (NPE), will help them successfully manage their disorder because it's personalized to meet their specific needs and challenges.

NEUROPSYCHOLOGICAL EVALUATION

An NPE assesses the patient's cognitive, motor, behavioral, language and executive functioning skills. We use the information obtained through the evaluation to diagnose psychological, behavioral, emotional and organic brain disorders and to develop a comprehensive and effective action plan.

SPECIALTIES

- ADHD
